

The Cause-and-Effect Problem in Regulated Environmental Monitoring

Rohan Sadler, Mark Garkaklis

1. Astron Environmental Services
2. School of Agricultural and Resource Economics, The University of Western Australia (adjunct)

Audit of Environmental Management Effectiveness: *New South Wales Parks & Wildlife Service*

- The audit concluded that “the *Service* has yet to:
 - Clarify what constitutes success in reserve management
 - Develop an adequate information base to measure success”

NSW Auditor-General performance audit of the NSW Parks and Wildlife Service (NSW Audit Office, 2004).

Audit of Environmental Management Effectiveness:

New South Wales Parks & Wildlife Service

- The audit concluded that “the *Service* has yet to:
 - Clarify what constitutes success in reserve management
 - Develop an adequate information base to measure success”
- “Consequently the Service cannot reliably determine how well it conserves and protects our natural heritage. This is a common situation for like agencies.”

NSW Auditor-General performance audit of the NSW Parks and Wildlife Service
(NSW Audit Office, 2004).

Summary

- Measuring environmental management effectiveness

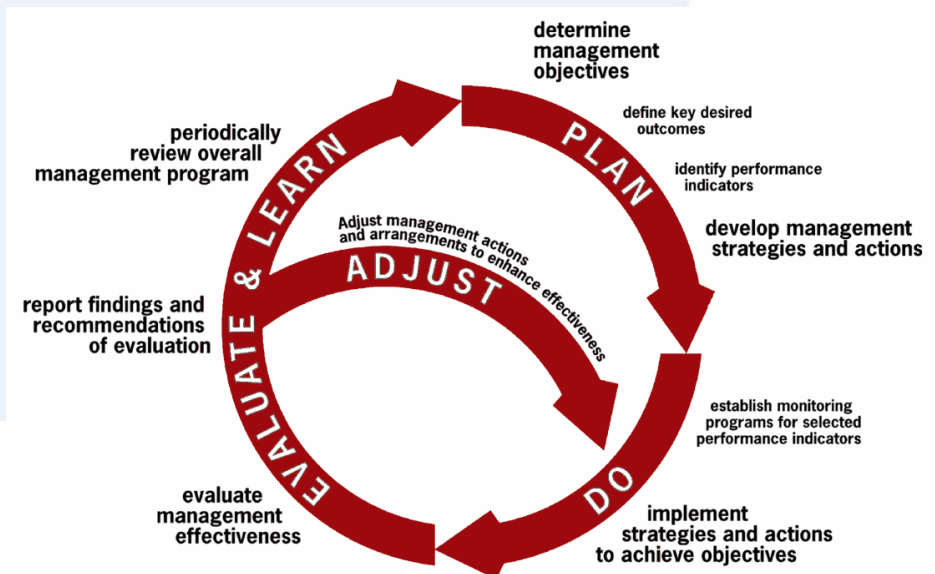

Summary

- Measuring environmental management effectiveness
- A framework for monitoring performance
 - IUCN ME Framework

Summary

- Measuring environmental management effectiveness
- A framework for monitoring performance
 - IUCN ME Framework
- Adaptive management
 - Policy drivers and continual improvement

Summary

- Measuring environmental management effectiveness
- A framework for monitoring performance
 - IUCN ME Framework
- Adaptive management
 - Policy drivers and continual improvement
- Case studies of monitoring effectiveness
 - managing populations

Summary

- Measuring environmental management effectiveness
- A framework for monitoring performance
 - IUCN ME Framework
- Adaptive management
 - Policy drivers and continual improvement
- Case studies of monitoring effectiveness
 - managing populations
- Information needs - Ecoinformatics

Summary

- Measuring environmental management effectiveness
- A framework for monitoring performance
 - IUCN ME Framework
- Adaptive management
 - Policy drivers and continual improvement
- Case studies of monitoring effectiveness
 - managing populations
- Information needs - Ecoinformatics
- From policy to implementation
 - policy as a blunt instrument

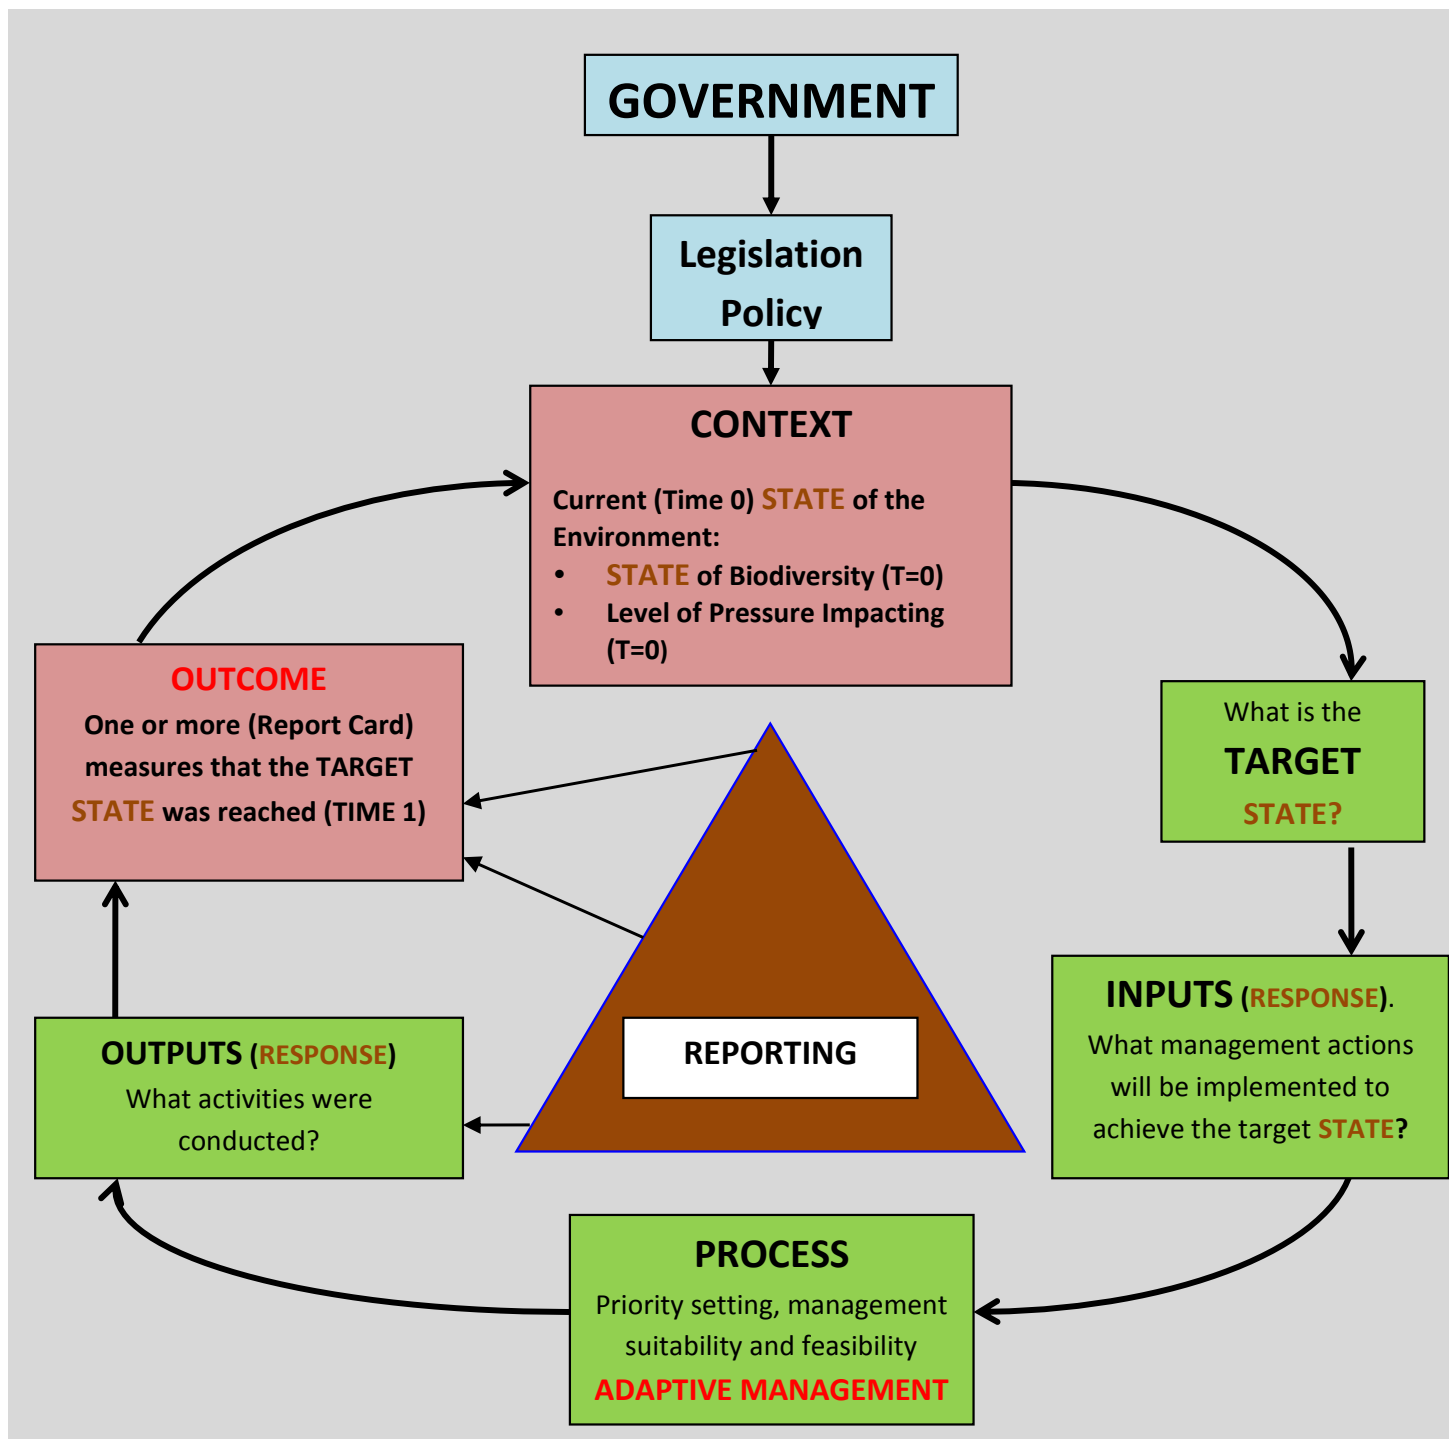

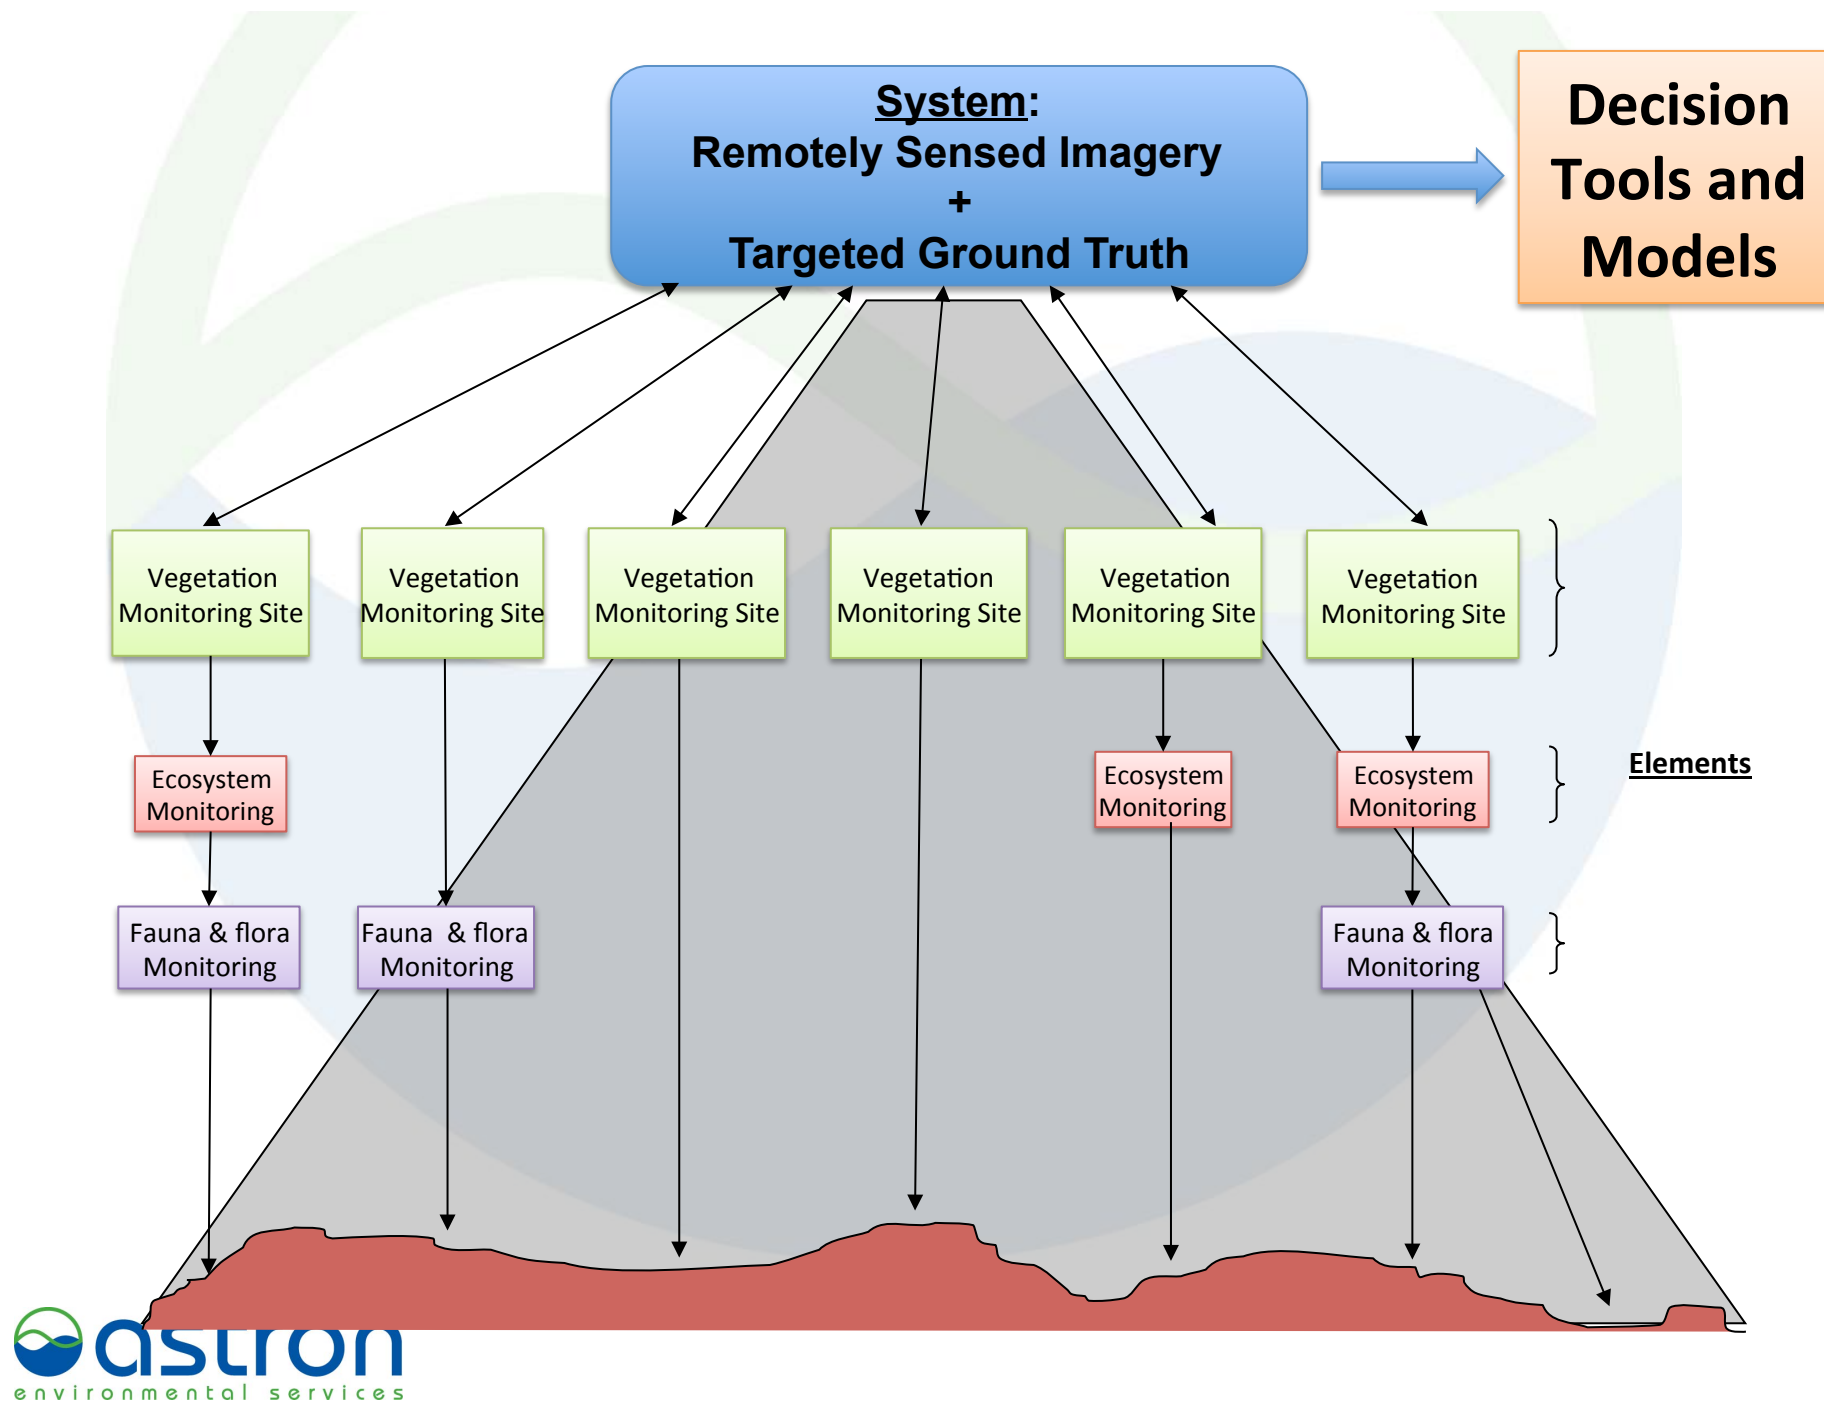

A framework for transparency: IUCN Monitoring and Evaluation

- IUCN ME Framework used in evaluating management effectiveness of protected areas.
 - The Western Australian DEC: Biodiversity Conservation Appraisal System

A framework for transparency: IUCN Monitoring and Evaluation

- IUCN ME Framework used in evaluating management effectiveness of protected areas.
 - The Western Australian DEC: Biodiversity Conservation Appraisal System
- Direct biodiversity investment through an auditable process of:
 - Identifying key biodiversity values across the state that must be protected.
 - Identify the threat (pressure) degrading these values
 - Provide mechanism to introduce Adaptive Management to address these threats.
 - Monitor and evaluate management effectiveness

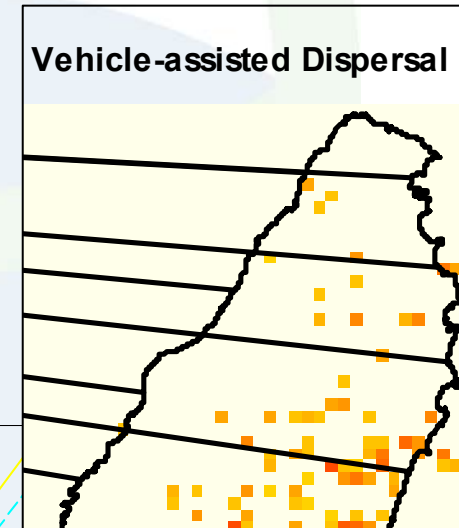

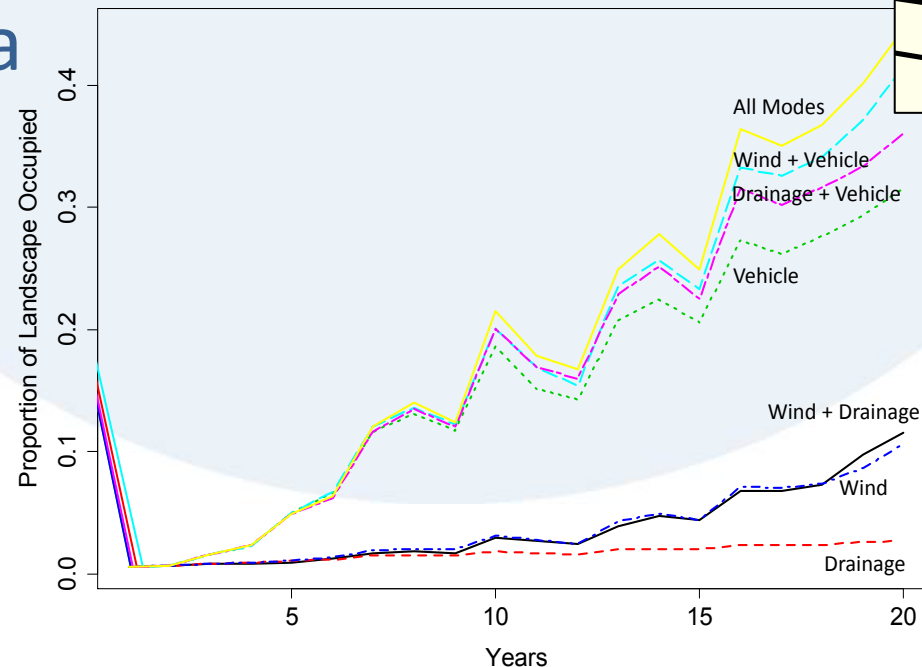

Population Monitoring: Risk of Weed Spread

- Buffel Grass (*Cenchrus ciliaris*)
 - ubiquitous environmental weed in northern Australia
- Management Goal: complete eradication
 - pre-impact state in 1960s
- Where to invest in control:
 1. Quarantine
 2. Contain vectors of dispersal
 3. Eradication (life stage? timing?)

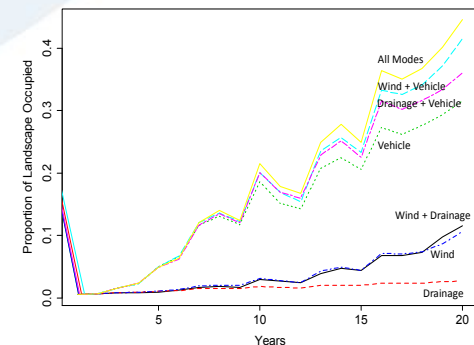

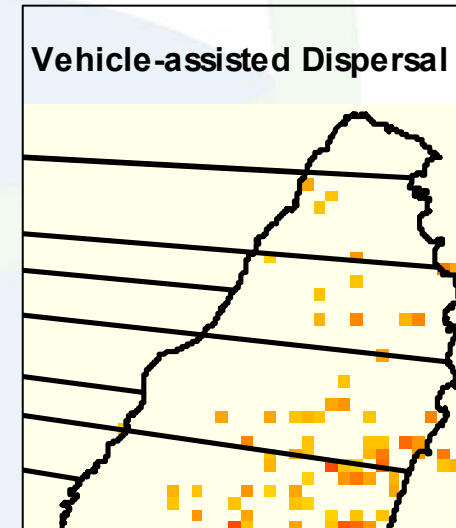

Population Monitoring: Risk of Weed Spread

- Spatially explicit population model
- Intra-vehicular monitoring system
- Parameters assumed.
- Little data

Population Monitoring: Risk of Weed Spread

- Spatially explicit population model
 - Intra-vehicular monitoring system
 - Parameters assumed.
 - Little data.
-
- Identified critical factors in weed success

Population Monitoring: Risk of Weed Spread

- Spatially explicit population model
 - Intra-vehicular monitoring system
 - Parameters assumed.
 - Little data.
-
- Identified critical factors in weed success
 - Future: responsive to cyclones

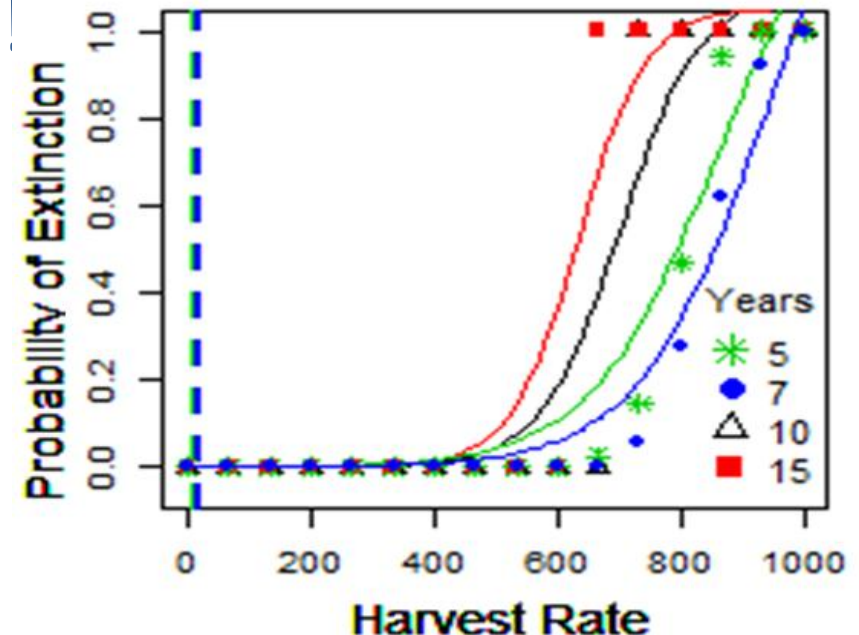

Population Monitoring: Infrastructure Impacts on Marsupial Populations

- Island site containing marsupial populations
 - Road kill during construction is reported
 - Wallabies (mobile)
 - Bandicoots (non-mobile)
- Management Goal
 - Robust population during construction phase
- How much road kill is tolerable?
 - Population parameter uncertainty

Population Monitoring: Infrastructure Impacts on Marsupial Populations

- Mobile, slow reproducing populations at risk.
- Static, fast reproducing populations were not.
- But wider dispersing populations are genetically more robust!

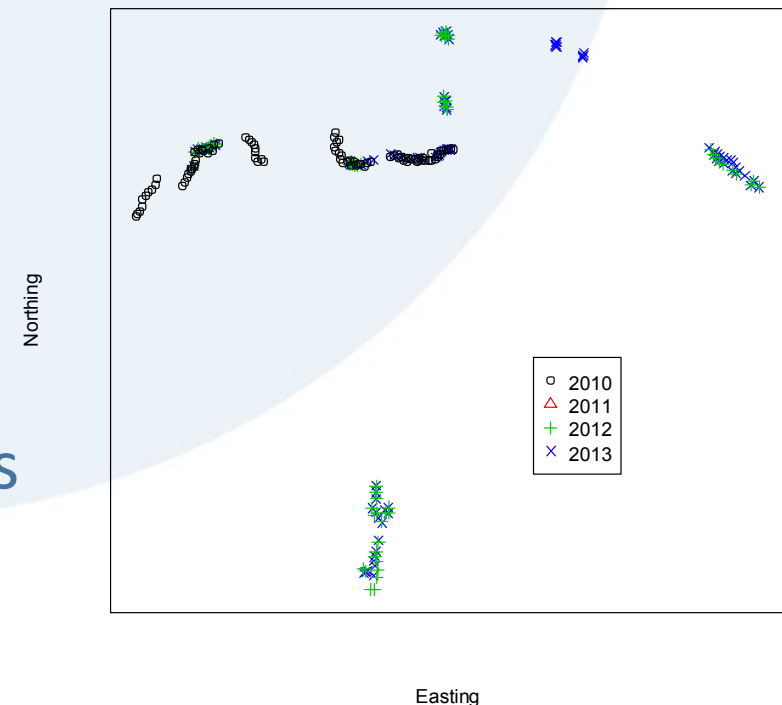

New Technologies: Ecoinformatics

- Camera traps
 - Sensor arrays
 - Automated id

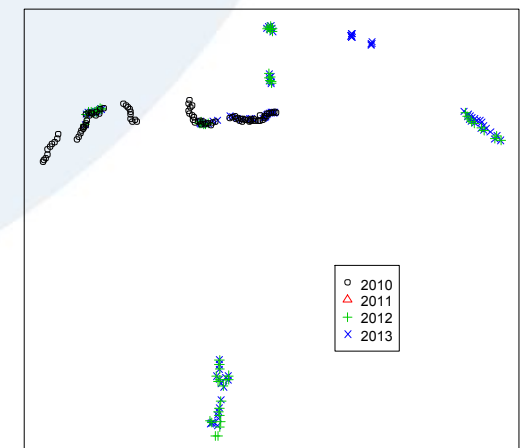

New Technologies: Ecoinformatics

- Camera traps
 - Sensor arrays
 - Automated id
- Spatially explicit surveys
 - capture probabilities
 - dispersal rates
 - statistical inference
 - impact and resource effects

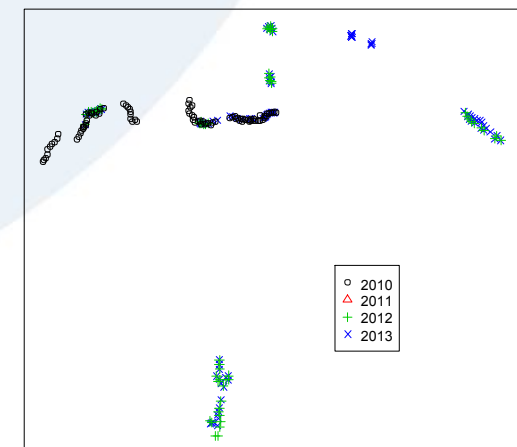

New Technologies: Ecoinformatics

- Camera traps: sensor arrays and automated ID
- Spatially explicit surveys
- Relative risk of capture probabilities
 - mixtures of different trap types and arrays
 - optimal survey design
- Digital chipping and tagging (e.g., Argos): animal movement
- Field based ring-buffer servers, rugged notepads, GNSS systems

New Technologies: Ecoinformatics

- Camera traps: sensor arrays and automated ID
- Spatially explicit surveys
- Relative risk of capture probabilities
 - mixtures of different trap types and arrays
 - optimal survey design
- Digital chipping and tagging (e.g., Argos): animal movement
- Field based ring-buffer servers, rugged notepads, GNSS systems
- Analytical products
 - Scenario and regional models: cumulative impacts
 - Spatio-temporal analysis: BACI framework
 - Decision tools: optimal management and policy
 - Dashboard reporting and report carding
- Information platform (web based databases)

Implications for Policy

- Policy now has a huge influence on how ecological monitoring to demonstrate compliance is undertaken
- IUCN framework + technology
 - stimulates more rigorous and sophisticated monitoring products
- Implications of key knowledge uncertainties need to be understood for policy design
- Well intentioned policy still carries risk of mis-specification in the absence of knowledge
